Find, Protect, & Restore
SEAGRASS
Join the Coastwatch SEAGRASS Campaign 2021

www.Coastwatch.org or email us at survey@Coastwatch.org

Zostera marina: A prominent species of seagrass in Europe, it forms the subtidal seagrass meadow.

Zostera noltii: Seagrass acts as a powerful carbon sink – even this thin lawn.

Seagrass Meadow: Hold sediment in place with a network of roots & rhizomes.

Red Mullet: An important commercial species found in seagrass where it is a habitat for many fish and invertebrates.

Eggs of sea hare and netted whelk: Seagrass are the perfect hatchery and nursery for many fish and invertebrates.

Brent Geese: Seagrass is an essential nutrient-rich food for these migratory birds.

Arthropoda: Seagrasses are home to rare species like this nudibranch.

Corkwing Wrasse: Seagrass provides habitat for many sea creatures at different times of their lives.

Coastwatch Training: Most people do not recognize seagrass – join us to find out more.
